ABSTRACT

Please replace the abstract that appears on page 13 of the specification with the following revised abstract which is submitted on a separate sheet.

Abstract

~~Provided~~ A fill-level measuring device for measuring a fill level of a fill substance $[(3)]$ in a container ~~(5) is a fill-level measuring device~~, which, following a single commissioning, can be used in a plurality of applications. The fill-level measuring device includes: A measuring unit $[(7)]$, which serves to produce a measurement signal $[(M)]$ dependent on the fill-level $[(1)]$; a memory $[(19)]$, in which parameter sets for different applications are stored; and an evaluating unit $[(17)]$, which serves for selecting a parameter set, for deriving, on the basis of this parameter set, the fill level $[(1)]$ from the measurement signal $[(M)]$, and for making such fill level $[(1)]$ available for further processing, evaluation and/or display.
